

PL25 M23 — BIFUNCTIONAL cell-wall hydrolase (Slt35-like + M23, CwlT-like architecture)

Zn²⁺ active-site residues (HxxxD + HxH)

Residue (mature form numbering, Δ signal anchor)

- Blue box: Slt35-like glycoside hydrolase (cleaves PG glycan)
- Red box: M23 metallopeptidase (cleaves PG cross-peptide)
- Orange box: N-terminal hydrophobic TM anchor (in full-length only)
- Yellow box: Zn²⁺ catalytic residues

N-terminal TM anchor (residues 19-46 of full-length protein) removed from mature form. SignalP6 predicts OTHER = 1.000 (NO cleavable signal-peptide) — protein is membrane-anchored with extracellular catalytic domains.
