

PL25 M23 — bifunctional cell-wall hydrolase (Slt35-/Lysozyme-like fold + Pfam M23, CwIP-like architecture)

Zn²⁺ active-site residues (canonical HxxxD + HxH)

Residue (mature form numbering, Δ signal anchor)

- Slt35-/Lysozyme-like glycoside hydrolase (fold-level)
- M23 metallopeptidase (Pfam PF01551)
- N-terminal hydrophobic TM anchor (full-length only)
- Zn²⁺ catalytic residues

N-terminal TM anchor (residues 19–46 of full-length protein) removed from mature form. SignalP6 predicts OTHER = 1.000 (no cleavage) and Gene3D, but is BELOW the Pfam PF01464 HMM detection threshold. The CwIP-like architectural assignment therefore rests on fold-homology rather than Pfam family membership.
