

PL25_M23 — bifunctional cell-wall hydrolase, CwIP-like architecture (AlphaFold2)
Full-length 370 aa • modelled region (residues 38-370) • mean pLDDT = 88.7

A — Front view

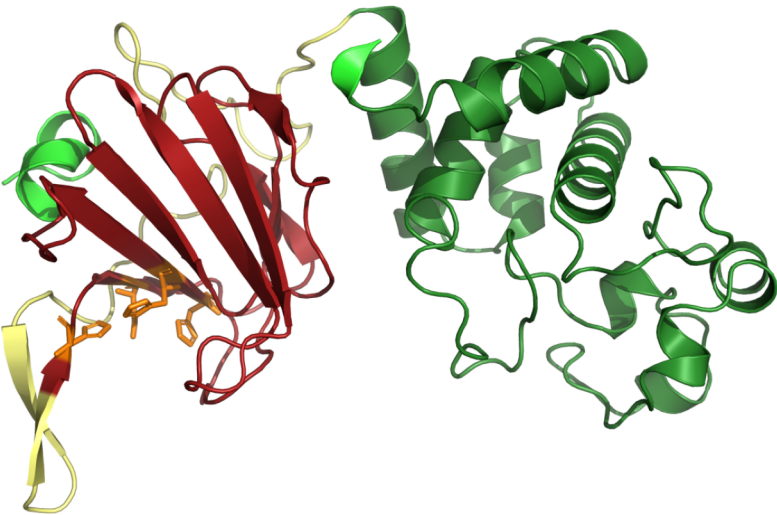

B — 90° rotation

Slf35-like glycan hydrolase (blue, N-terminal) + M23 peptidase (red, C-terminal)

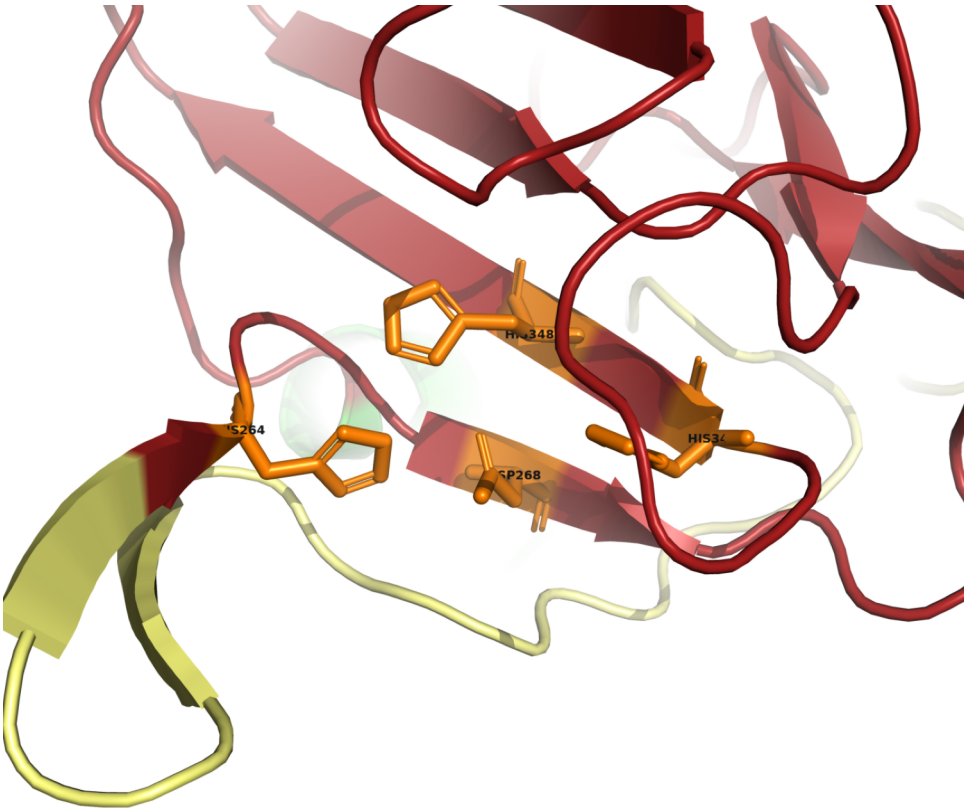

Two-domain architecture clearly separated

C — 180° back view

Linker (grey) bridges the two catalytic domains

D — M23 putative Zn²⁺-binding site

H264, D268, H346, H348 (HxxxD + HxH motifs, full-length numbering)

 Slf35-like glycan hydrolase fold (residues 70-222)	 M23 peptidase (residues 263-360; PF01551)
 Linker region (residues 223-262)	 Putative Zn ²⁺ -binding residues (H264, D268, H346, H348)
