

PL25_M23 shows bactericidal activity against Gram-positive bacteria, including MRSA

Assay: OD₆₀₀-normalised bacterial suspensions were incubated with PL25_M23 at 100 µg/mL or with PBS (negative control) for 2 h at 37 °C, serially diluted, and spotted on LB agar to enumerate surviving CFU. Bars in (a) show mean log₁₀ CFU mL⁻¹ ± SD with individual replicates as black dots (n = 3 per condition). Significance: Welch's t-test on log₁₀-transformed CFU/mL data; *p < 0.05; **p < 0.01; ***p < 0.001; ns = not significant. Bars in (b) show the mean log₁₀ reduction in viable counts and the corresponding percentage killing. Data are from a single experiment with three technical replicates; biological-replicate confirmation is recommended.
